EDUCATION

Chapman University, Orange, CA

May 2026

Bachelor of Science in Computer Science, minor in Game Development Programming

Relevant Courses:

- Data Structures and Algorithms | Database Management | Data Comm/Networking | Operating Systems | Algorithm Analysis | Discrete Math | Computer Graphics | Quantum Mechanics | Programming Languages

TECHNICAL SKILLS

- C++ | C# | SQL | Python | Java | JavaScript | HTML/CSS | PostgreSQL | MySQL | Git/GitHub | TCP/IP | VLANs | UniFi Network Controller | Ubiquiti | Agile

PROFESSIONAL EXPERIENCE

Code Zero - Security Consulting (Intern)

January 2025 - March 2025

- Configured a Ubiquiti Enterprise Fortress Gateway, 5 PoE switches, and 5 wireless access points to deploy a networking and security system for a commercial client across a 60,000+ sq ft facility
- Wired and calibrated Ethernet infrastructure to deliver internet connectivity and physical security as a single cohesive system
- Configured VLANs and TCP/IP settings using Ubiquiti software to segment traffic and harden network security in a live production environment

Newport Aquatic Center, General Staff

May 2023 - August 2024

- Managed customer service operations, handling concurrent needs of multiple patrons
- Streamlined service processes, reducing the steps required to complete customer transactions

TECHNICAL PROJECTS

Game Analytics Database, PostgreSQL, Python

July 2026

- Designed a 7-table relational schema modeling multiplayer match and session data, supporting mid-match hero-switching and ability-level event tracking through a session-based data model
- Built a Python data generator producing a 23.6M-row synthetic dataset (3,000 players, ~9,900 matches), deliberately encoding a known behavioral pattern into the data to validate analytical findings against ground truth
- Diagnosed and resolved a data-pipeline performance bottleneck caused by per-row inserts and foreign-key constraint checks root-caused with Claude Code, cutting full-dataset generation from a multi-hour projection to under 4 minutes using batched inserts and constraint management
- Wrote analytical SQL using window functions (PERCENT_RANK, NTILE), CTEs, and self-joins to surface a 2.6x correlation between repeated deaths to the same ability and player abandonment, build cohort retention curves, and identify and correct for a confounding variable in a churn analysis

Full-Stack Application Development, Python/MySQL

November 2025 – December 2025

- Built a full-stack application with a MySQL backend and Python/Tkinter frontend, covering schema design through UI
- Implemented indexes, views, stored procedures, and transactions to optimize queries and enforce ACID compliance under concurrent use

Wizard King (Game), C#

September 2025 – May 2026

- Collaborated within a 4-person team over a 9-month production cycle to design, build, and ship a complete Souls-like game to Steam, placing 3rd in the IEEE GameSig development competition
- Built custom 3D levels, animation systems, and combat mechanics to create an immersive player experience
- Produced original art and audio assets end-to-end, establishing a distinct visual and audio identity throughout the game
- Coordinated development using Git/GitHub and Jira, running Agile sprints across the full production cycle

ACADEMIC AWARDS

Dean's Scholarship, Merit

August 2022 – May 2026

GameSig IEEE Game Competition, 3rd Place

May 2026
